

1) Gate: Are Anchors needed?

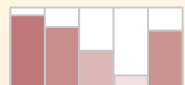

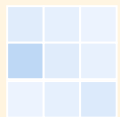

Base proposal: The [MASK] Tower is in [MASK] .

Weak support
context commits
give to masked
tokens

vs.

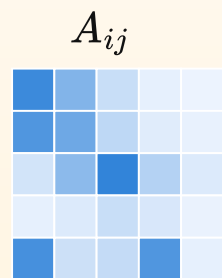

High pace
many
committed
tokens

**High
uncertainty**
of remaining
tokens

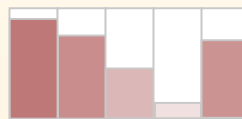

2) Anchor Selection

Attention

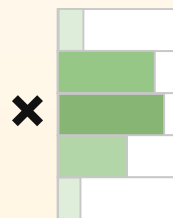

**Residual
uncertainty**
 $1 - c_i$

×

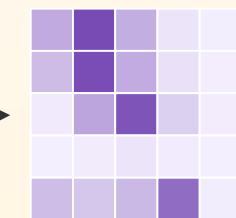

**Candidate
confidence**
 c_j

×

Utility matrix

$$W_{ij} = A_{ij} (1 - c_i) c_j$$

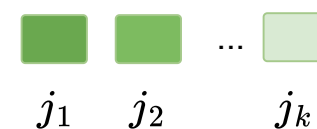

Coverage Objective

$$C(S) = \sum_{i \in \mathcal{M}} \max_{j \in \mathcal{S}} W_{ij}$$

Cover uncertain tokens with high utility.

Greedy Selection

3) Inject Anchors

The [MASK] Tower [MASK] [MASK] Paris .

Stronger context results in
higher confidence, lower coupling
of residual tokens.
